

Whales and Fish

Whales and fish both live in the water, but they are different in many ways. Whales are large animals that live in the water. Even though whales live in the water, they must come to the top of the water to get air. When they come to the top of the water, whales breathe in air through a hole in the top of their heads. At the same time they blow out old air. Whales don't get air like fish. Fish take in air from the water.

Mother whales give birth to live whales. The baby whale must come to the top of the water right away for air. The baby drinks milk from its mother for about a year. Then it finds its own food. Fish have babies in a different way. Most mother fish lay eggs. The babies are born when the eggs hatch. Right after they are born, the baby fish must find their own food.

Whales and fish are alike in some ways too. Whales and fish have flippers on their sides. They also have fins on their tails. Flippers and fins help whales and fish swim. Fins move and push the water away.
